Abstract

Implementation of Python Project to analyze different data set sourced via public domain and generate valuable insight by visualizing information. Using this project I am trying to build a model to predict heart disease using machine learning.

Analysis of different data sets sourced from various domains and generate meaningful insights using different visualization methods. In this project given various clinical parameters about a patient, performing prediction whether they have heart disease or not. I have used "**Cleavland data for Machine Learning**" to train my model.

Introduction

As part of Fidelity International Data Analytics Training, I have implemented basic concepts of Python, Data Science and Machine Learning. Public domains like Kaggle and Covid 19 India.org are the data source of this project.

Dataset

- **Disney + Movies and TV Shows Data:**
<https://www.kaggle.com/datasets/shivamb/disney-movies-and-tv-shows>
- **Hulu Movies and TV Shows Data:**
<https://www.kaggle.com/datasets/shivamb/hulu-movies-and-tv-showsv>
- **Covid 19 India Data** = <https://data.covid19india.org/>
- **Tweets data** = <https://www.kaggle.com/code/jiashenliu/how-can-we-predict-the-sentiment-by-tweets>

Reason for selecting Kaggle as it consists of variety of data sets which we can use for Data Analytics, Data Science and Machine Learning. As this is my first learning experience where I used Kaggle, explored and build models and work holistically.

Covid 19 India data sets is very unique and easy to understand the real world problem like to interpret global pandemic situation across the country and it is very useful in the current situation.

Reason for using Tweets Data – Reason for using tweets data is to perform sentiment analysis and to use regular expression pattern, am extracting all hash-tags from Tweets Data which can be further visualized using visualization libraries like Matplotlib.

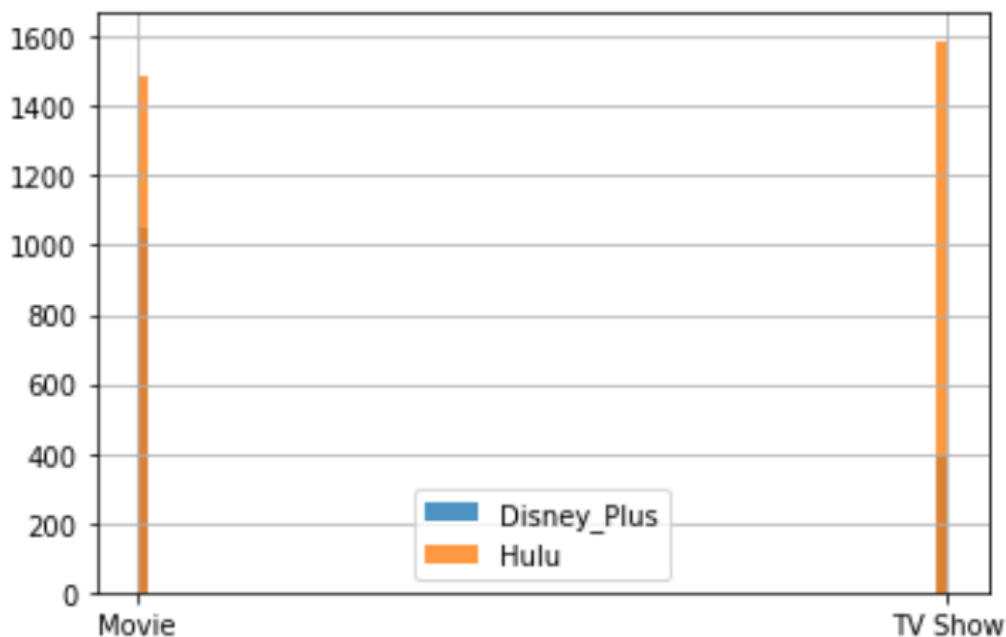

Implementation Process

Below are the steps that I've used for implementation -

- Data Selection and Exploration – The goal here is to find out what questions we are trying to solve and data selection and exploration is the key here.
- Importing the Data – Importing the data into Python project using Pandas function
- Data Analysis and Data Cleaning – Analyzing the data and imputing missing data so that our model predicts accurately.
- Data Modelling – Split data to training and tests data sets.

Results

- Chart 1 - Categorization of data (Movie & TV Show) between Disney+ and Hulu

- Chart 2 (Sentiment Analysis) – Graph showing different moods of users between different feature of Tweets Dataset.

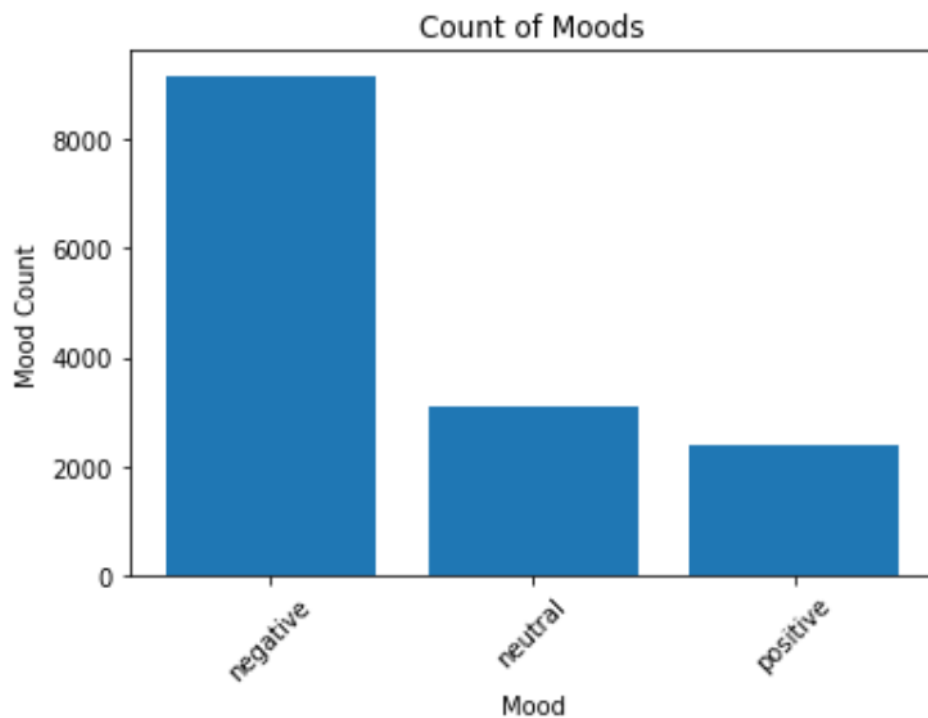

Chart 3 - Heart Disease Frequency (Age vs Sex) – Graph showing heart disease frequency according to sex.

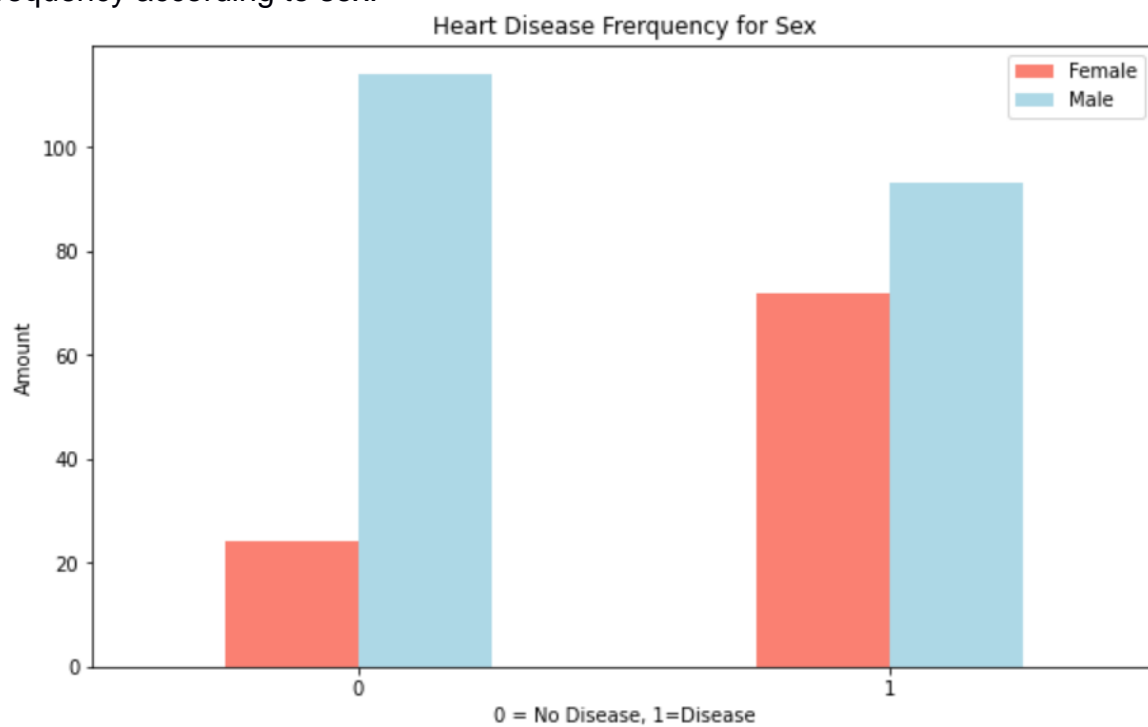

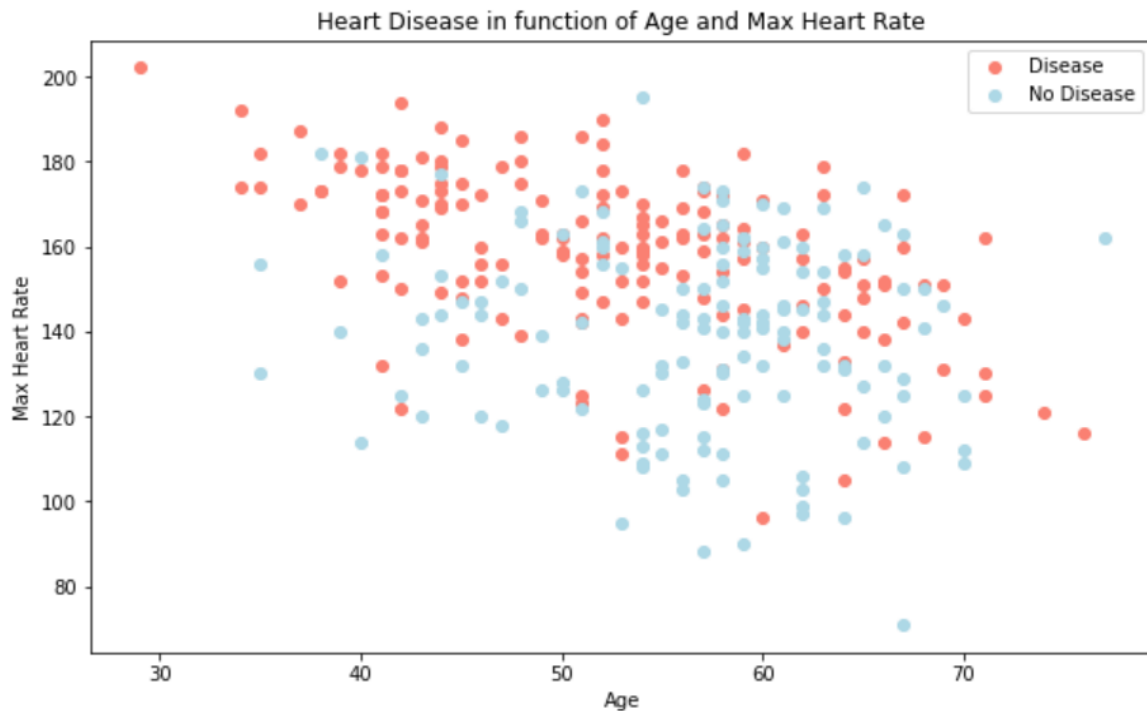

Chart 4- Age vs. Max Heart Rate for Heart Disease

Insights

- Hulu has more content as compared to Disney Plus.
- From the above plots we can easily find out that the distribution of moods For first three airlines are always skewed toward negative moods.
- From the barchart above, the frequency of female getting heart disease is higher in this dataset compared to male.
- The chances of getting maximum heart rate is higher for heart disease patients.
